

Lips

Outer Layer (epidermis)

Very thin and delicate, flakes and dries easily. It is made of dead cells and has no blood supply

Inner Layer (dermis)

Good blood supply - gives colour to lips

BAREFACTS

Malpighian Layer

Cells in this layer divide to produce new cells

Lipsticks Ingredients

Castor oil

Microcrystalline wax

Wax

Other mineral oils

Minerals and colourings

Castor oil and wax help to lubricate and moisten the skin

Skin Protection

SPF factors may be included in the lipstick formula – this helps to reduce lip damage from UV light, but the base products of waxes and lanolins give excellent protection from dryness and also aid softening of the skin. Lipsticks are not intended to replace lip salves – which are designed to give protection from the sun.
